

# BFS ProfiPlus

Fertiliser Services

A highly effective urea-based foliar application to enhance protein content in milling wheat

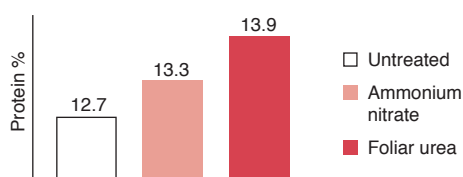

**BFS ProfiPlus** is a complex foliar-applied fertiliser that increases protein levels and helps to achieve milling quality in wheat. It is formulated from a selection of urea-based products that ensure both rapid uptake and slower release of nitrogen, making the product more efficient than straight urea solutions. It also contains seaweed extract as well as readily absorbable sulphur and magnesium to help boost nitrogen uptake.

## Key benefits of BFS ProfiPlus

- Increases protein levels and quality in milling wheat, and loaf volume in bread, boosting the existing benefits of foliar-applied urea which are shown below:

### Protein levels

Average of 22 ADAS trials following application of 40 kgs/ha of N

- Foliar application ensures rapid uptake, even in dry conditions
- Sulphur and magnesium can increase uptake of nitrogen
- Can be delivered in 1,000 litre IBCs.

### Application guidelines

Apply to the ear at GS 69–75 (end of flowering to milky stage)  
Medium to coarse BFS Air Bubble Jets 04 or 05 are ideal  
Apply in cool conditions, for example, early morning or late evening  
Avoid application in bright sunlight, high temperatures and strong winds.

### Rate of application

Standard dressing – 25 kgs/ha N (100 l/ha diluted in 100 litres of water)  
High yielding varieties - 31kgs/ha N (125 l/ha diluted in 75 litres of water)  
Each option requires 200 l/ha of mixed product to be applied.
